Exploring the IT sector

The "Exploring the IT sector" initiative, which is being implemented with the support of NetcompanyIntrasoft for the school year 2023-2024, aims to enhance student's understanding of the IT field and industry, inspiring them to envision, in the modern labor market, a future career in IT.

Netcompany-Intrasoft employees serve as mentors by sharing their knowledge and experience in the IT industry and presenting the different paths that students can choose in their IT studies, the tech trends and developments in the coming years.
Some of the topics include: the daily life of a programmer, the digital and horizontal skills necessary to work in an IT company, the current technological developments in the industry, how the company encourages the younger generation as well as women to pursue careers in ICT, the contribution of technology to environmental protection and the importance of cyber security.

The action is addressed to high school students, with emphasis on schools in rural areas, and aims to:
- enhance students' understanding of the IT sector and its impact;
- inspire students using examples of both female and male IT professionals in order to help them start envisioning their future and pursue a career in IT;
- help students to be better informed on IT studies, the prospects and specializations, the latest tech trends, and the skills needed to work for an IT company;
- showcase the developments and highlight new opportunities offered in the coming years in the IT field.
